What is polydioxanone ?

The mini threads are made of polydioxanone (PDO), an extremely safe material used regularly in heart surgery and which encourages cell cohesion.

PDO is a reabsorbable sterile suture thread; completely safe, it doesn't produce allergic reactions and rejection, nor does it have any side effects.

PDO produces fibrosis in the surrounding area, giving rise to the creation of type I and III collagen.

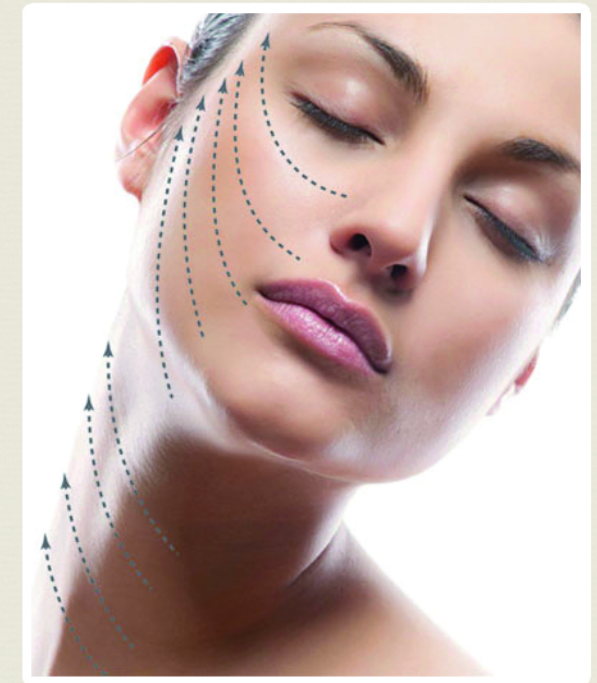

The body reabsorbs the threads over a period of 6 to 8 months via biological (enzymatic) absorption or hydrolysis.
