## REVOLUTIONARY TREATMENT FOR AGEING

### A facelift without surgery

### The Ultra V Lift

#### When and how can the effects be seen?

The tension of the embedded threads produces a soft lifting effect right from the very first moment.

The threads start working immediately. From the 3rd week onwards, the real effect starts to appear.

The greatest effect is reached at around 2-3 months

If necessary, treatment can be repeated, implanting new threads until the desired effect is achieved.

Top up treatments can be carried out at any time.

The Ultra V lift is a new lifting method based on the implantation of multiple Polydioxanone (PDO) mini threads, creating a vectorial network that acts as support for the tissue.

It produces a **lifting effect** while also **favouring natural collagen production**.

It stimulates **skin rejuvenation**, bringing **vitality, elasticity and brighter skin tone**.

**It improves** the appearance of **minor wrinkles, nasiolabial folds and loose skin**.

**Highly effective in both facial and body treatments.**

It can be applied at the surgery, as it only requires local anaesthetic. There is no need for hospitalisation.

There is **no recovery period** needed and you can carry on your daily routine immediately, even applying make up.

Treatment is safe and practically painless.

The Ultra V lift is not a replacement for a facelift and will not achieve the same results .
